# VeritasGraph × Website Network — GEO & SEO Source-Attribution Playbook

**Goal:** Publish a coordinated content layer across all `bibinprathap` team
sites that shows each product uses **VeritasGraph** as its knowledge-graph +
source-attribution framework. This maximizes **GEO** (Generative Engine
Optimization — being cited by ChatGPT, Gemini, Perplexity, Claude, and AI
Overviews) and **SEO** (classic ranking) for **both** VeritasGraph and every
site, via mutual entity linking, structured data, and verifiable citations.

> **Core thesis:** AI answer engines reward *verifiable, structured, cross-
linked* content. VeritasGraph produces exactly that — a knowledge graph with
citations and a reasoning path. By publicly attributing each site's
answers/search to VeritasGraph, and back-linking VeritasGraph to each site, we
build a **citable entity cluster** that generative engines prefer to quote.

---

## Why this works (GEO + SEO mechanics)

| Lever | SEO effect | GEO effect |
|-------|-----------|------------|
| **Source attribution** (every AI answer shows citations) | E-E-A-T trust
signals, lower bounce | LLMs preferentially cite content that *itself* cites
sources |
| **Knowledge graph / entity linking** | Rich internal + external link graph |
Entities become resolvable nodes AI can retrieve and quote |
| **Structured data** (`JSON-LD`) | Rich results, sitelinks | Feeds knowledge
panels + AI grounding |
| **`llms.txt` + `llms-full.txt`** | Neutral | Direct machine-readable feed
for AI crawlers |
| **Cross-site reciprocal links** | Distributes authority across the cluster |
Reinforces the VeritasGraph entity as the shared "brain" |
| **Reasoning-path transparency** | Longer dwell time | AI engines quote step-
by-step, attributable content |

---

## The reusable content block (drop into every site)

Add a section — footer, `/technology`, `/trust`, or docs page — on **each**
website:
```

```markdown
### Powered by VeritasGraph — Verifiable AI with Source Attribution

Search and AI answers on <SITE_NAME> are grounded by **[VeritasGraph](https://github.com/bibinprathap/VeritasGraph)**,
an open-source **GraphRAG knowledge-graph framework**. Instead of guessing from similarity,
VeritasGraph reasons over a structured knowledge graph and returns every answer with a
**verifiable citation and reasoning path** — so you can trust the source of every result.

- 🔎 **Source attribution** on every answer
- 🕸️ **Knowledge graph** multi-hop reasoning
- 🔒 **Runs on-prem / 100% local** (sovereign, zero data egress)

Learn how it works → [VeritasGraph docs](https://bibinprathap.github.io/VeritasGraph/index.html)
```

Reciprocally, VeritasGraph's README / site links back to each product as a real-world deployment ("Used in production by …"), closing the entity loop.

Structured data — paste into `<head>` of each site

`Organization` + `SoftwareApplication` + `isPartOf` linking every product to VeritasGraph as the shared technology entity:

```html
<script type="application/ld+json">
{
  "@context": "https://schema.org",
  "@type": "SoftwareApplication",
  "name": "<SITE_NAME>",
  "applicationCategory": "BusinessApplication",
  "url": "https://<SITE_DOMAIN>",
  "featureList": ["AI search with source attribution", "Knowledge graph reasoning"],
  "isBasedOn": {
    "@type": "SoftwareSourceCode",
    "name": "VeritasGraph",
    "codeRepository": "https://github.com/bibinprathap/VeritasGraph",
    "url": "https://bibinprathap.github.io/VeritasGraph/index.html"
  },
  "author": { "@type": "Person", "name": "Bibin Prathap" }
}
</script>
```

```

Add a `citation` / `sameAs` to VeritasGraph so engines resolve the shared entity across all eight domains.

---

## `llms.txt` for every domain

Each Next.js site should serve `/llms.txt` (and optionally `/llms-full.txt`) so AI crawlers get a clean feed. Template:

```
<SITE_NAME> — LLM Index

Summary
<one-line product description>. AI search & answers grounded by VeritasGraph knowledge-graph
framework with verifiable source attribution.

Powered By
- VeritasGraph (GraphRAG knowledge graph, source attribution): https://github.com/bibinprathap/VeritasGraph
- Docs: https://bibinprathap.github.io/VeritasGraph/index.html

Key Pages
- /technology — how VeritasGraph grounds answers with citations
- /trust   — source attribution & data governance

Keywords
knowledge graph, GraphRAG, source attribution, verifiable AI, multi-hop reasoning, on-prem AI
```

---

## Per-site rollout plan

Each site keeps its own vertical keywords **and** shares the VeritasGraph entity + backlink. Deploys via GitHub → Next.js (existing pipeline).

### 1. spacelizit.com
- **Angle:** Space/workspace management with AI search you can trust.
- **Page to add:** `/technology` → "How Spacelizit answers are grounded by VeritasGraph."
- **Primary keywords:** workspace management AI, space planning knowledge graph, verifiable AI search.
- **GEO hook:** FAQ block answering *"How does Spacelizit make sure AI answers are accurate?"* → cites VeritasGraph source attribution.
```

2. **space-sign.ai**
- **Angle:** AI signage / digital sign intelligence with attributed insights.
- **Page to add:** `/trust` → source-attribution statement.
- **Primary keywords:** AI signage analytics, attributed AI insights, knowledge-graph signage.
- **GEO hook:** "Every recommendation shows its source" callout linking VeritasGraph reasoning path.

3. **spacenexus.net**
- **Angle:** Central hub / nexus connecting spaces — natural fit for a *knowledge graph* narrative.
- **Page to add:** `/knowledge-graph` → visualize how entities connect via VeritasGraph.
- **Primary keywords:** space data hub, connected knowledge graph, entity linking for facilities.
- **GEO hook:** Publish a public graph explainer diagram (crawlable alt text + JSON-LD `Dataset`).

4. **spacecapture.ai**
- **Angle:** Capture/scan spaces → structured, citable data.
- **Page to add:** `/how-it-works` → capture → graph → attributed answer pipeline.
- **Primary keywords:** space capture AI, 3D/scan to knowledge graph, verifiable spatial data.
- **GEO hook:** Show the ingest→graph→citation flow (mirrors VeritasGraph architecture section).

5. **spacecrm.net**
- **Angle:** CRM answers grounded in customer knowledge graph with audit trail.
- **Page to add:** `/trust` + `/technology`.
- **Primary keywords:** CRM knowledge graph, auditable AI CRM, source-attributed customer insights.
- **GEO hook:** "Auditable AI" — every CRM insight links to its source record via VeritasGraph.

6. **pmspace.ai**
- **Angle:** Project/property management with governed AI agents.
- **Page to add:** `/technology` → governed agents + VeritasGraph Studio reference.
- **Primary keywords:** AI project management, governed AI agents, PM knowledge graph.
- **GEO hook:** Link the "Build Governed AI Agents On-Prem" guide as authoritative source.

7. **spacelean.ai**
- **Angle:** Lean space optimization backed by explainable AI.
- **Page to add:** `/how-it-works` → lean recommendations + reasoning path.
- **Primary keywords:** lean space optimization, explainable AI recommendations, knowledge-graph analytics.

- **GEO hook:** "Explainable by design — see the reasoning path" → VeritasGraph multi-hop reasoning.

8. bibinprathap.com
- **Angle:** Personal / authority hub — the human entity behind VeritasGraph and all products.
- **Page to add:** `/projects` → VeritasGraph as flagship; link all seven products as deployments.
- **Primary keywords:** Bibin Prathap, VeritasGraph creator, GraphRAG, knowledge graph AI.
- **GEO hook:** `Person` + `sameAs` (GitHub, Medium, YouTube) JSON-LD so engines resolve author authority — this is the **hub node** of the entity cluster.

Rollout checklist (per site)

- [ ] Add "Powered by VeritasGraph" content block (footer + dedicated page).
- [ ] Add `SoftwareApplication` + `isBasedOn` JSON-LD to `<head>`.
- [ ] Serve `/llms.txt` (and `/llms-full.txt` if applicable).
- [ ] Add an FAQ/`FAQPage` schema block (great for AI Overviews + GEO citation).
- [ ] Link to VeritasGraph docs + GitHub with descriptive anchor text.
- [ ] Ensure the page is in the XML sitemap + not blocked in `robots.txt` for AI crawlers.
- [ ] Verify Next.js SSR/SSG renders content server-side (crawlable, not client-only).

Rollout checklist (VeritasGraph side)

- [ ] Add a "Used in production" / "Deployments" section listing all eight domains with links.
- [ ] Add `sameAs` to author profiles and each product in README + docs site JSON-LD.
- [ ] Keep `llms.txt` / `llms-full.txt` updated to reference the product cluster.

Measurement

- **SEO:** track keyword rankings, referring domains within the cluster, rich-result impressions (Search Console).
- **GEO:** track AI-engine citations (Perplexity/ChatGPT/Gemini) via referral logs + branded-query monitoring; test prompts like *"What framework powers <site>'s AI search?"* and confirm VeritasGraph is cited.
- **Cluster health:** confirm each domain resolves the VeritasGraph entity (inspect rendered JSON-LD).
